SUMMARY

SDET with 2+ years of experience engineering scalable test automation and quality infrastructure for fintech products. Architected Playwright/JavaScript and Java/Cucumber automation frameworks covering 565+ test cases across 20 modules and 3 client environments. Experienced across UI, API, database, and mobile automation, with hands-on ownership of CI/CD (GitHub Actions) and Oracle DB validation. Strong track record in root-cause analysis, production defect investigation, and building QA practices from the ground up as a company's first SDET hire.

KEY ACHIEVEMENTS

- Architected a Playwright test automation framework from scratch using JavaScript and Page Object Model (POM), scaling to 565+ test cases across 20 modules and 3 client environments.
- Engineered a combined API + database + UI verification layer (Oracle DB via SSH tunneling), going beyond UI-only automation.
- Root-caused and resolved a production-impacting API auth bug, restoring passing API tests — a direct production-quality save.
- Built a company's QA process from the ground up as one of its first 5 hires at an early-stage startup, spanning manual test planning through early automation.
- Tracked 100+ defects to resolution using Jira, collaborating directly with developers across 6+ client environments.

TECHNICAL SKILLS

Automation Frameworks: Playwright, Selenium, Cucumber (BDD), Page Object Model (POM)

Mobile Test Automation: Appium (in progress — converting manual mobile/APK test cases to automation for multi-client apps)

Languages: JavaScript, Java, Python, SQL, TypeScript (academic/coursework)

Testing Types: Functional, Regression, Smoke, Integration, End-to-End, Exploratory Testing

API & Integration Testing: Postman, REST APIs, Status Code & JSON Response Validation

Database Testing: SQL Query Writing, Database Validation, Oracle DB, MySQL (academic project)

CI/CD & Version Control: Git, GitHub, GitHub Actions, Automated Test Execution & Failure Investigation

Build Tools: Maven, Gradle

Defect & Test Management: Jira, GitLab, Slack, Defect Lifecycle, Test Cases, Test Plans, Automation Documentation

GenAI Tools: Claude (test case generation, debugging, identifying automation opportunities)

Soft Skills: Problem Solving, Analytical Thinking, Root Cause Analysis, Cross-Team Collaboration

TECHNICAL EXPERIENCE

CreditNirvana – A Perfios Company

Apr 2026 – Present

SDET

Bengaluru

- Joined as the first SDET at the company, establishing automation practices and QA infrastructure from the ground up.
- Architected a Playwright/JavaScript test automation framework with a multi-client configuration architecture, scaling to 565+ test cases across 20 modules and 3 client environments.
- Engineered a separate API and database test layer, connecting to Oracle DB via SSH tunneling for direct DB → API → UI verification — extending coverage beyond UI-only automation.
- Integrated automated testing into CI/CD by implementing a GitHub Actions pipeline that runs the test suite and generates reports on every push and pull request.
- Root-caused a production-impacting API auth bug (a stray header causing 401 errors) and resolved it, restoring passing tests — a direct production-quality fix.
- Executed both manual and automated functional, regression, smoke, and exploratory testing across 14 fintech clients (web and mobile); tracked 100+ defects to resolution in Jira across 6+ client environments, collaborating directly with developers to verify fixes.
- Converted to a full-time SDET role after the internship, based on the strength of the automation framework and defect-resolution track record built during the internship period.
- Engineered a second automation stack (Java + Cucumber BDD), initially built with Maven before migrating the build to Gradle; actively expanding test case coverage.
- Extending the Java + Cucumber + Gradle framework with Appium to bring previously manual mobile (APK) testing into automation across multiple client apps — an active, in-progress initiative.

slice (Slice Bank)*Product Operations***Jan 2026 – Apr 2026***Bengaluru*

- Validated production fintech transaction workflows through functional and exploratory testing, partnering with Product and Engineering to investigate and escalate customer-impacting issues quickly.
- Owned defect documentation and resolution tracking in a regulated fintech environment, maintaining QA standards under high transaction volume.
- Investigated recurring defect patterns through root-cause analysis, feeding findings back to the product team to prevent repeat production issues.

JaisPro*SDET***Jan 2025 – Dec 2025***Bangalore*

- Joined as one of the first 5 team members at an early-stage startup and established the company's initial QA process from the ground up, spanning manual test planning through early automation efforts.
- Owned end-to-end quality for web application releases, balancing hands-on testing with full-stack development support in a resource-constrained, fast-moving environment.
- Prioritized and triaged defects independently given limited QA headcount, directly influencing release readiness decisions.

Rooman Technologies Pvt Ltd*Application Developer – Web & Mobile***Sep 2024 – Feb 2025***Bangalore*

- Built structured test coverage across 4+ responsive client web applications and traced 30+ functional/performance defects to root cause, working directly with developers to prevent regression.

Nikki Build Edtech Private Limited*Full-stack Developer***Sep 2023 – Oct 2023***Bangalore*

- Gained first hands-on QA exposure verifying UI components and responsive design across screen sizes, building an early foundation in cross-device compatibility testing.

PROJECTS

API Test Automation Framework - [GitHub](#)*Python, Pytest, Requests, GitHub Actions*

- Built a Python API test automation framework using Pytest to validate CRUD operations, pagination, and concurrent request handling against a RESTful web service.
- Designed a reusable HTTP client abstraction and custom assertion utilities to decouple test logic from request handling, reducing duplication across test cases.
- Authored 11 automated test cases spanning positive, negative, and edge-case scenarios (status code validation, 404 handling, pagination, concurrency).
- Set up a CI pipeline with GitHub Actions that installs dependencies, runs the full test suite, and publishes HTML test reports as build artifacts automatically on every push and pull request.

Blockchain-Based Access Control Framework*Python, Ethereum, Smart Contracts***2024 – 2025**

- Designed functional and user-role-based test scenarios validating a decentralized access-control system integrating facial recognition with Ethereum smart contracts; verified authentication and authorization logic across multiple roles.

Web-Based Car Rental System*HTML, CSS, JavaScript, PHP, MySQL***2023 – 2024**

- Performed manual and functional testing on a full-stack car rental platform (user/admin modules, secure authentication, MySQL-backed schema), identifying and resolving UI and database defects for a stable release.
